# Relationships

# Relationships

# NEW in 3.1 - Association – new « Is Directed » attribute

- Association direction
  - Set by right click or properties
  - Visible in diagram
  - Managed in import / export tools

The screenshot displays the software interface for managing associations. On the left, a diagram shows a central node 'Customer satisfaction' connected to several other nodes: 'Systems should be customer facing', 'Provide online portfolio and claims management', 'Additional personnel cost should be limited', 'Single point of access for all insurance products', 'Frequent customer complaints (copy)', 'Integrated portfolio and claims management', and 'Loss of customers'. The right panel shows the 'Association' properties for the relationship between 'Customer satisfaction' and 'Frequent customer complaints (copy)'. The 'Is Directed' attribute is set to 'True'. A context menu is also visible, showing the 'Is Directed' attribute being selected.

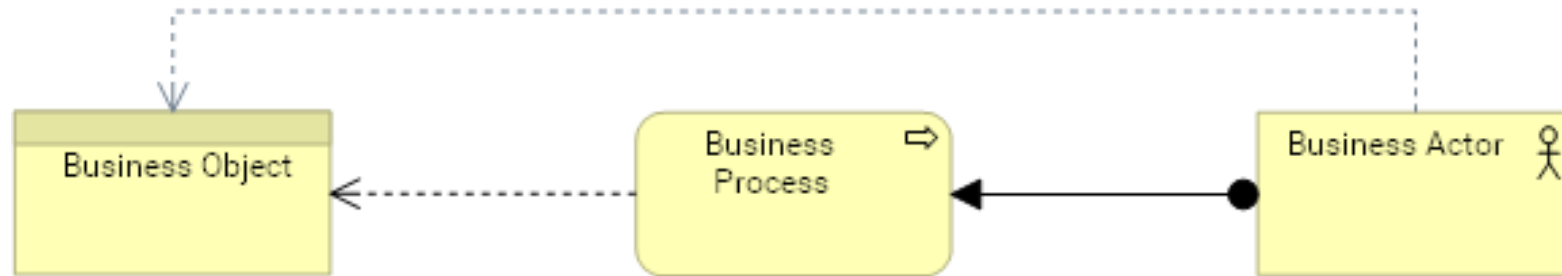

In association right click

In association relationships properties

# Derived relationships

Derived relationship appear as light grey in diagrams

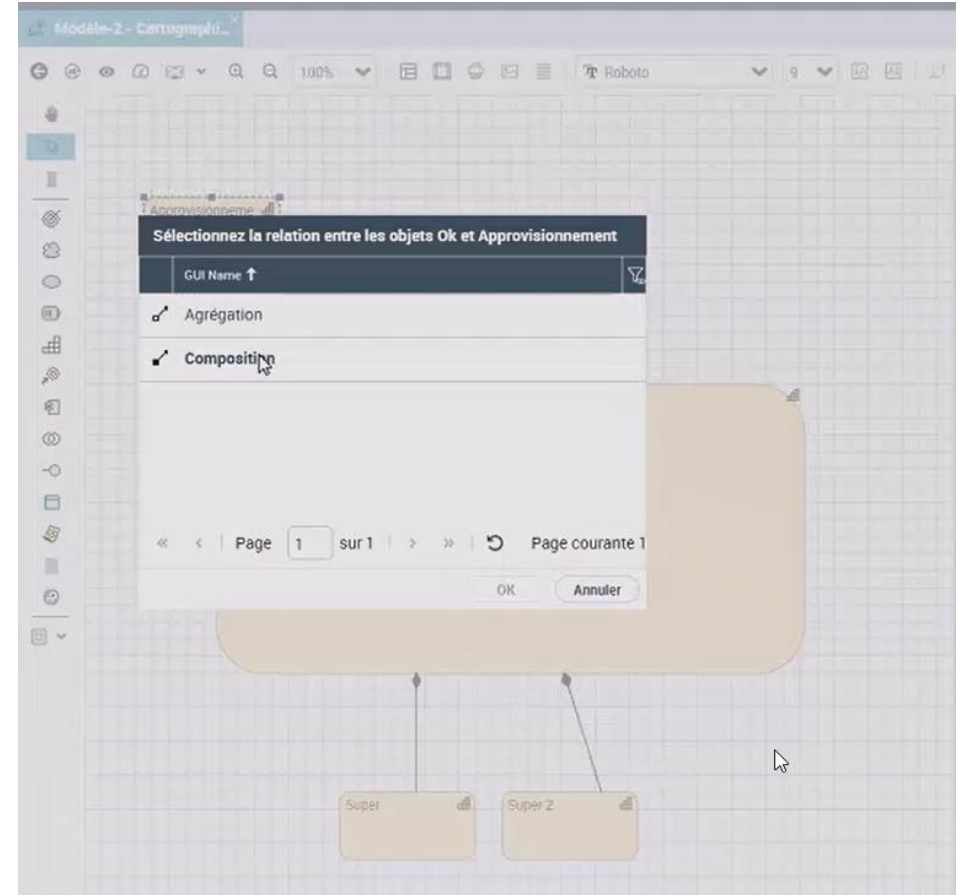

The screenshot shows a dialog box titled "Link" with a close button in the top right corner. Below the title bar, the text "Link type:" is followed by a list of options: "Access \*", "Association", and "Association". The "Access \*" option is selected, indicated by a mouse cursor and a small checkmark. At the bottom right of the dialog box, there are "OK" and "Cancel" buttons.

Derived relationship are marked as '\*' in the link creation UI

# Nesting support

- A pop-up window proposes the relevant relationships (structural + access + specialization) when drag and dropping an object within another object
  - If there is only one possibility, the relationship creation is silent
- Multiple selection is supported, both for same object types or heterogenous object types
  - The relationship type is asked for each link

# Viewpoint Mechanism

# Viewpoint Definition

- The viewpoint definition is declarative so that users can create their own viewpoints
- A viewpoint is defined by the selection of metaclasses to be displayed in the toolbar E.g.
  - the “Layered” viewpoint is defined by enabling all ArchiMate Concepts visibility
  - The “Capability Map” viewpoint is defined by enabling Capability, Outcome, Resource and Relationships

The screenshot displays the HOPEX ARCHIMATE software interface. On the left, a navigation pane shows 'Inventories' selected, with a list of viewpoints including 'Layered' and 'Capability Map'. The main area is split into two panels. The 'Layered' panel shows a 'Refresh Active DiagramTypeViews' button, dropdowns for 'Purpose' and 'Content', a 'Comment' field with the text 'Pictures several layers and aspects of an Enterprise Architecture in one diagram.', and a 'MetaClasses in Scope' section with a table containing 'ArchiMate Concept'. The 'Capability Map' panel shows a 'Refresh Active DiagramTypeViews' button, dropdowns for 'Purpose' and 'Content', a 'Comment' field with the text 'The capability map viewpoint allows the business architect to create a structured overview of the capabilities of the enterprise.', and a 'MetaClasses in Scope' section with a table containing 'ArchiMate Capability', 'ArchiMate Concept Relationship', 'ArchiMate Outcome', and 'ArchiMate Resource'. Three pink callout boxes point to the 'Layered' panel, the 'ArchiMate Concept' row, and the 'Capability Map' panel respectively.

# View Creation Wizard

- When creating a new view for a model, the applicable viewpoint can be selected
- This automatically activates the available “diagram views” in the ArchiMate diagram and opens the diagram with the corresponding toolbar
  - This is not restrictive; the user can activate / deactivate relevant “diagram views” in a diagram w/o having to change the viewpoint

# Properties

# Properties

- Properties can be user defined within a model, in applicable formats (e.g. "Production Date", in Date format)
- For a given property, the applicable concept can be defined (e.g. "Production Date" applies to Application Component only)
- The properties is then listed in the applicable elements' property page

The screenshot displays the ArchiMate tool interface with three overlapping windows:

- Creation of ArchiMate Property:** A dialog box for defining a new property. The 'Local name' is 'Production Date', the 'Owner' is 'My Model (Model)', the 'MetaAttribute Type' is 'AbsoluteDateTime64', and the 'MetaAttribute Format' is 'Standard'.
- Production Date Property Definition:** A configuration window for the 'Production Date' property. It shows the 'Name' as 'Production Date', '\_GUIName' as an empty field, 'MetaAttribute Format' as 'Standard', 'MetaAttribute Type' as 'AbsoluteDateTime64', and 'MetaAttribute Length' as a dropdown menu. The 'Default Internal Value' is an empty field. The 'Characterized Concept' is 'ArchiMate Application Component'.
- My App Properties:** A window showing the 'Production Date' property applied to an element named 'My App'. The property value is displayed as a calendar widget for October 2018, with the 10th of the month selected.

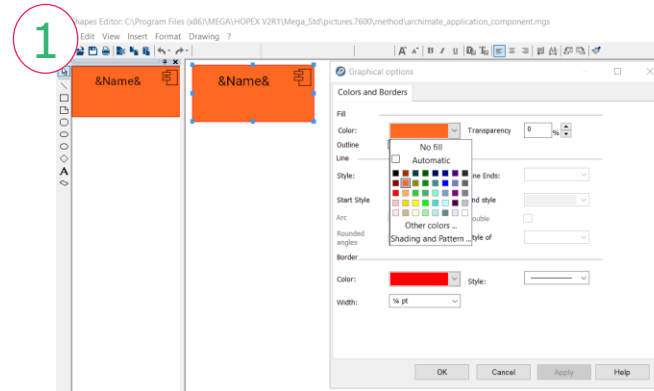

At the bottom of the interface, there is a toolbar with buttons for 'Connect', 'Reorganize', 'Properties', 'Remove', and 'Excel'. A table at the bottom shows the 'ArchiMate Application Component' with a 'Name' column.

# Appendix

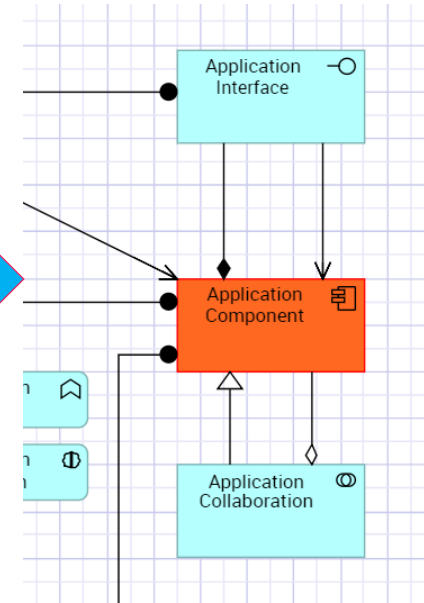

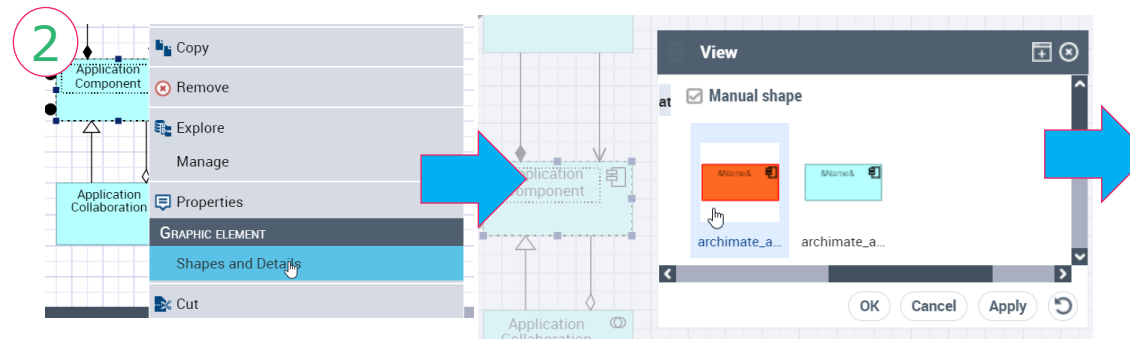

# Shapes Color changing

- Alternative shapes with different color settings can be defined for any ArchiMate shape through the HOPEX Studio shape editor, deriving from standard shapes (1)

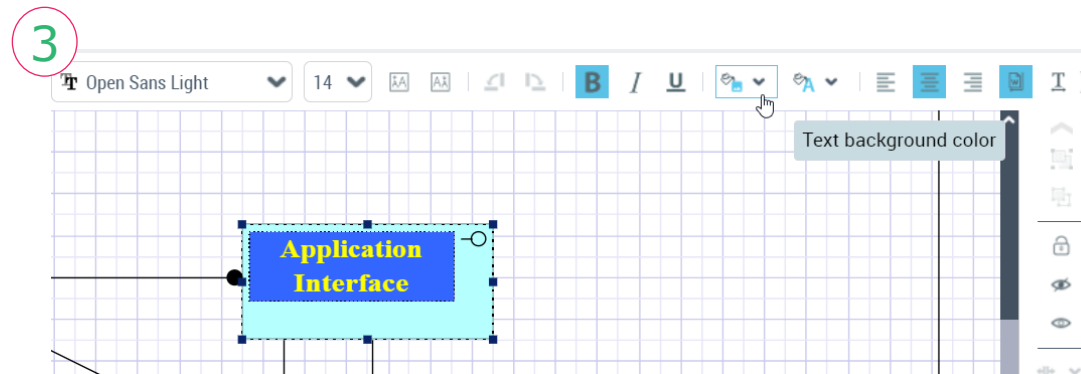

- The end user can access alternative shapes for an element in a diagram by right click > 'shapes and details' (2)

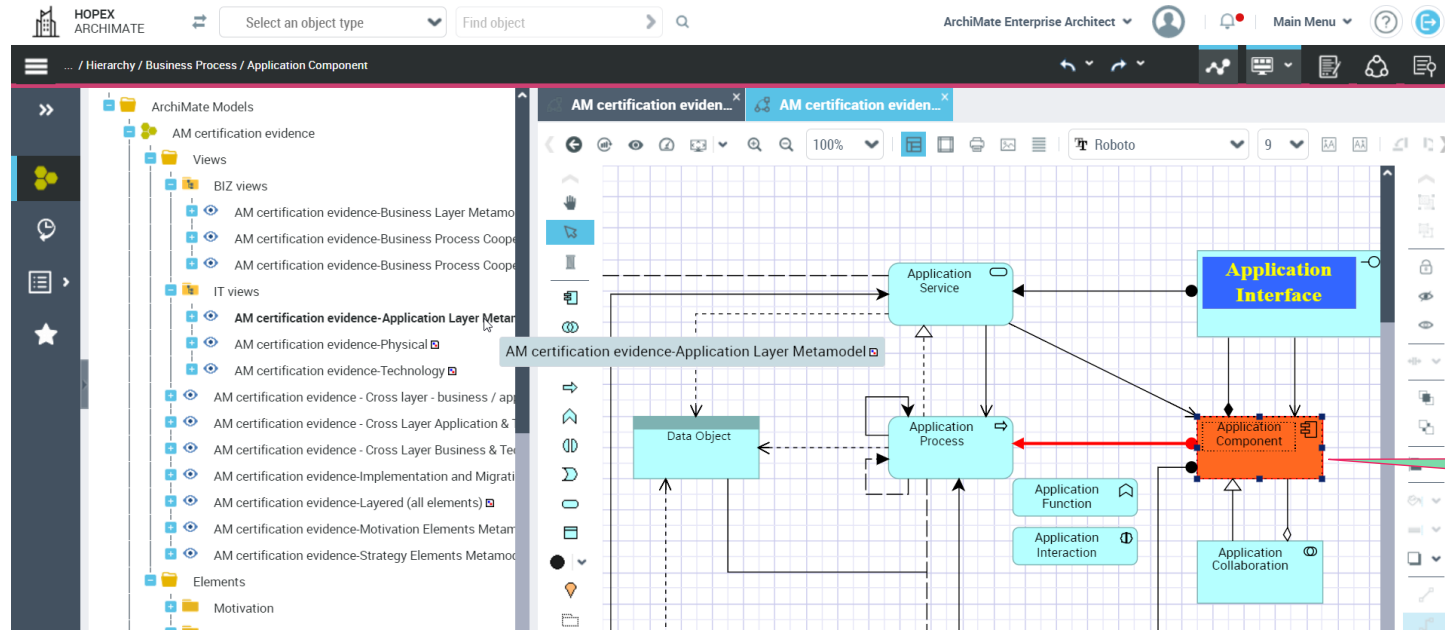

*Note: a shape can be automatically computed for an object (e.g. based on a test of an attribute value or link existence) or manually set by the end user*

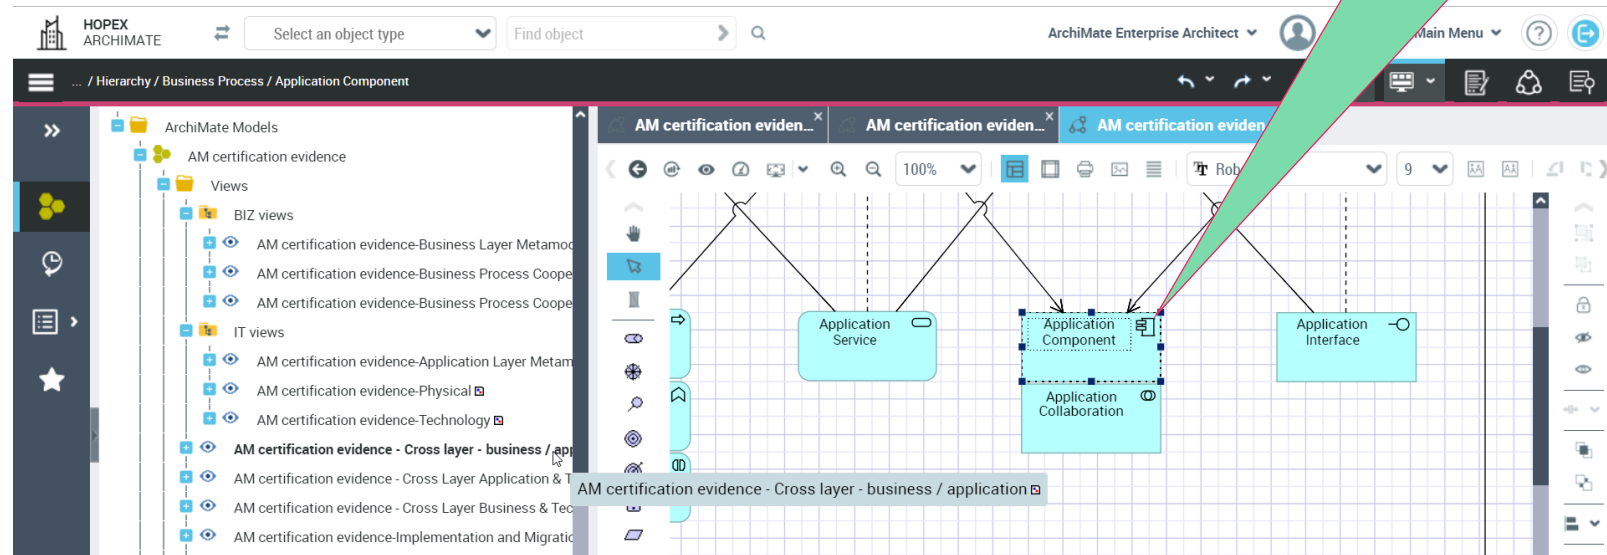

- Otherwise, the objects name font or color / background color can be changed by the end user using MS Office like font controls (3)

# Diagram specific shapes for the same object

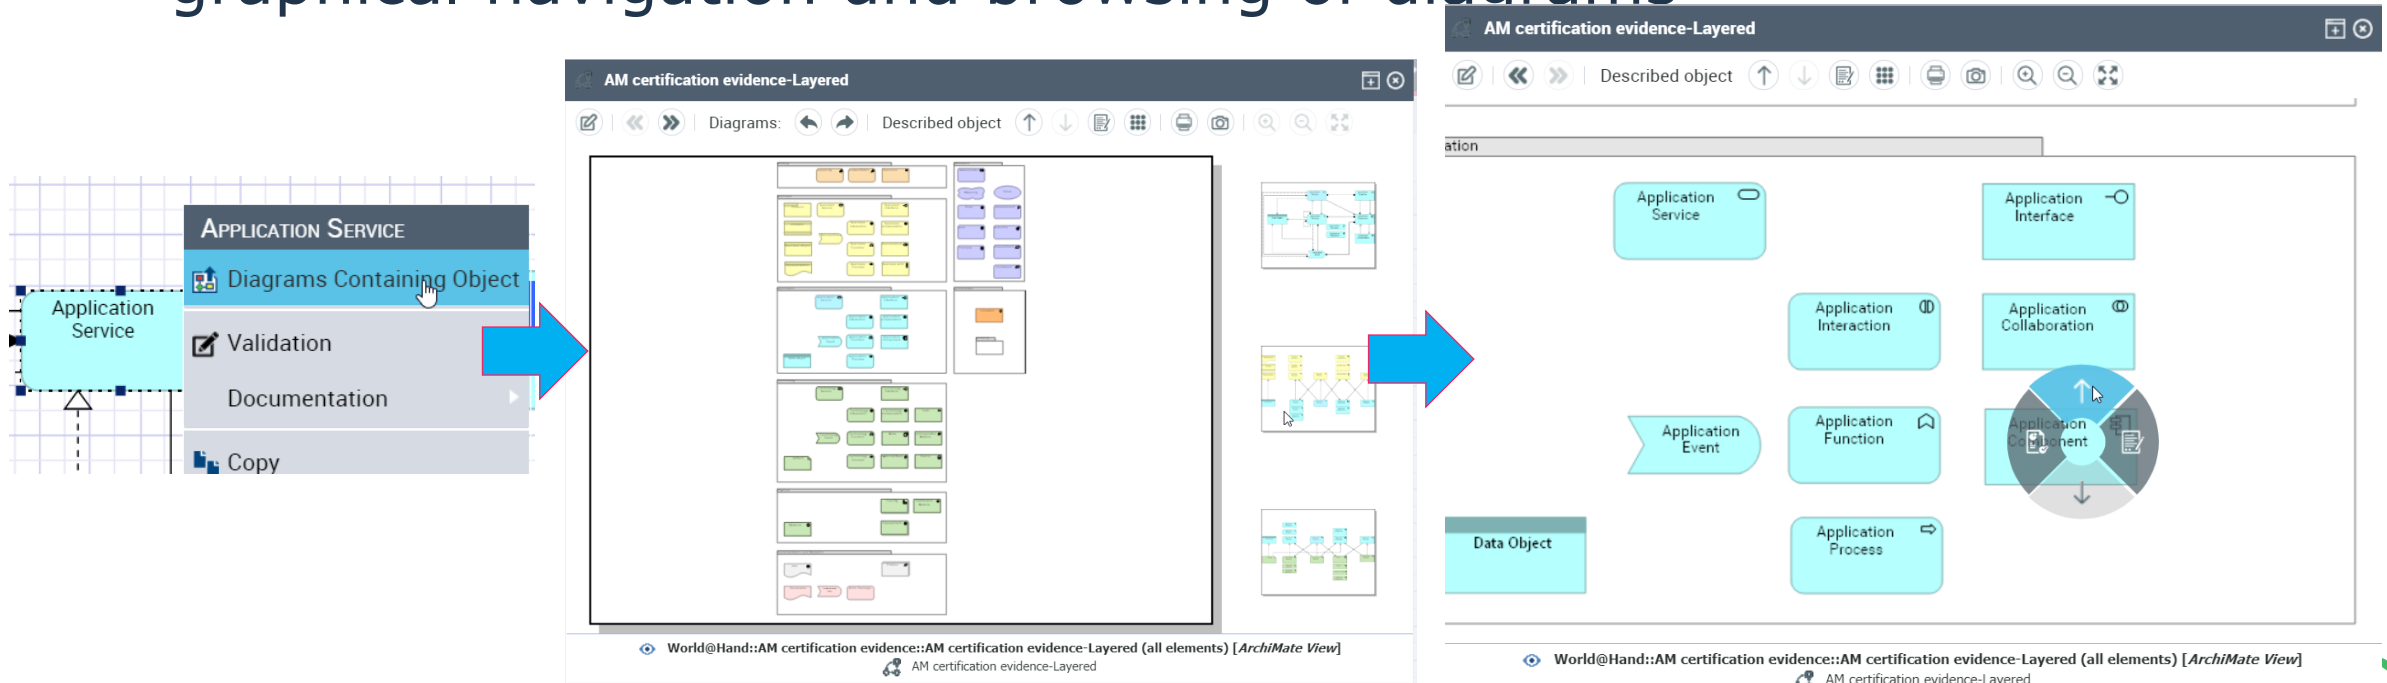

Same object with specific shape in different views / diagrams

# Drill up : diagrams containing an object

- Right click on an element > 'diagrams containing object' this element can be reach through a dedicated navigator showing all the diagrams the object appears in
- Additional navigation (drill up, drill down, properties) is then possible via a wheel within this diagram navigator, enabling easy graphical navigation and browsing of diagrams

# Objects in diagrams

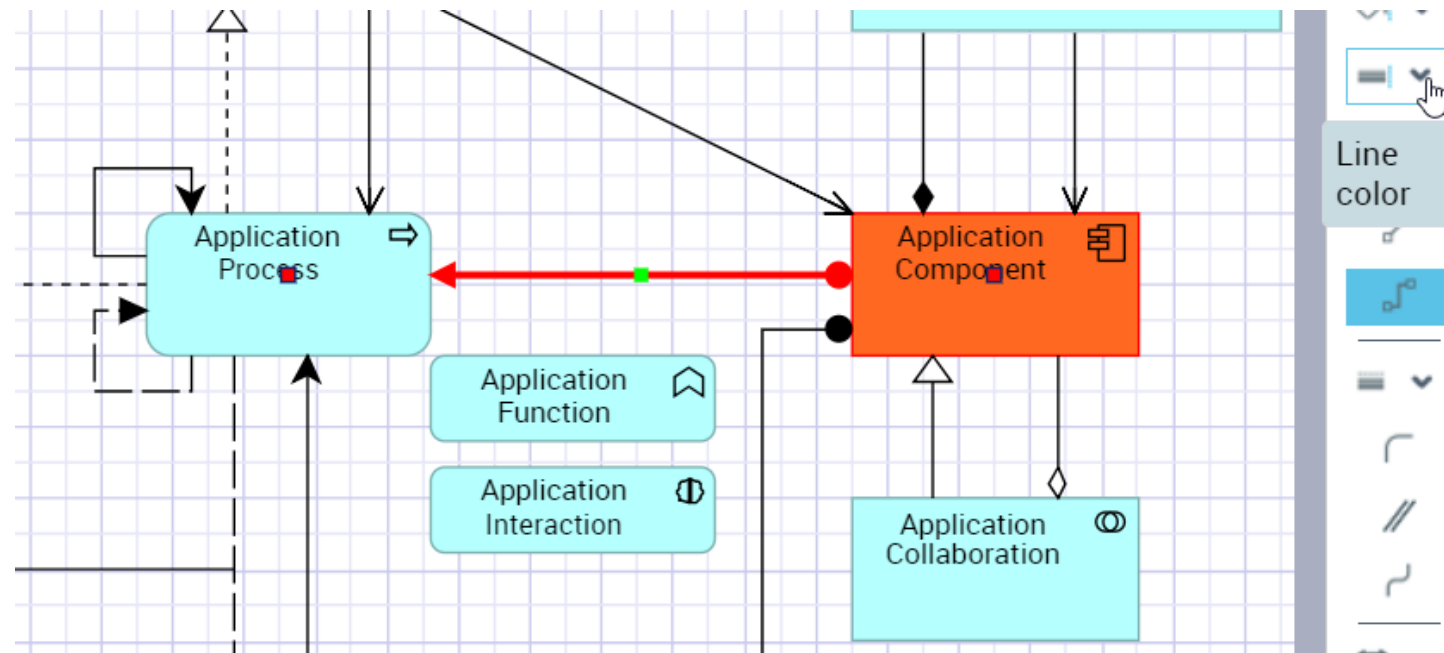

- Object properties (attributes, relationships) are consistently accessible for a given objects, regardless of the diagram it is accessed from

Change of the element reflect in all views

rename

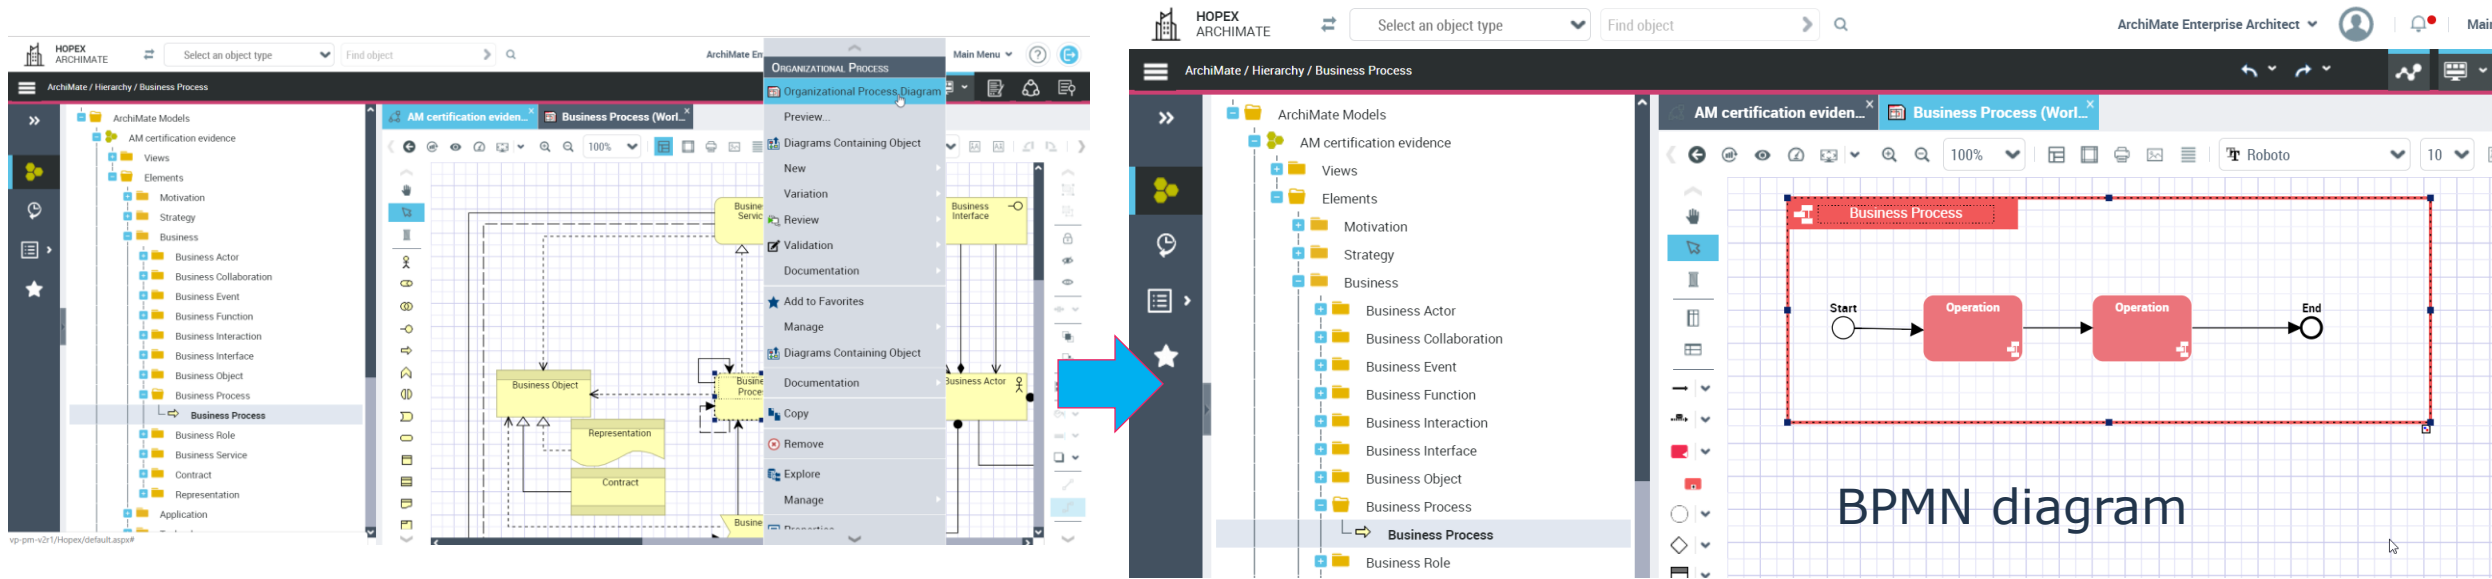

# Relationships color & width

- Relationships line color and width can be changed by the end user using MS Office like controls

# From ArchiMate to other notations

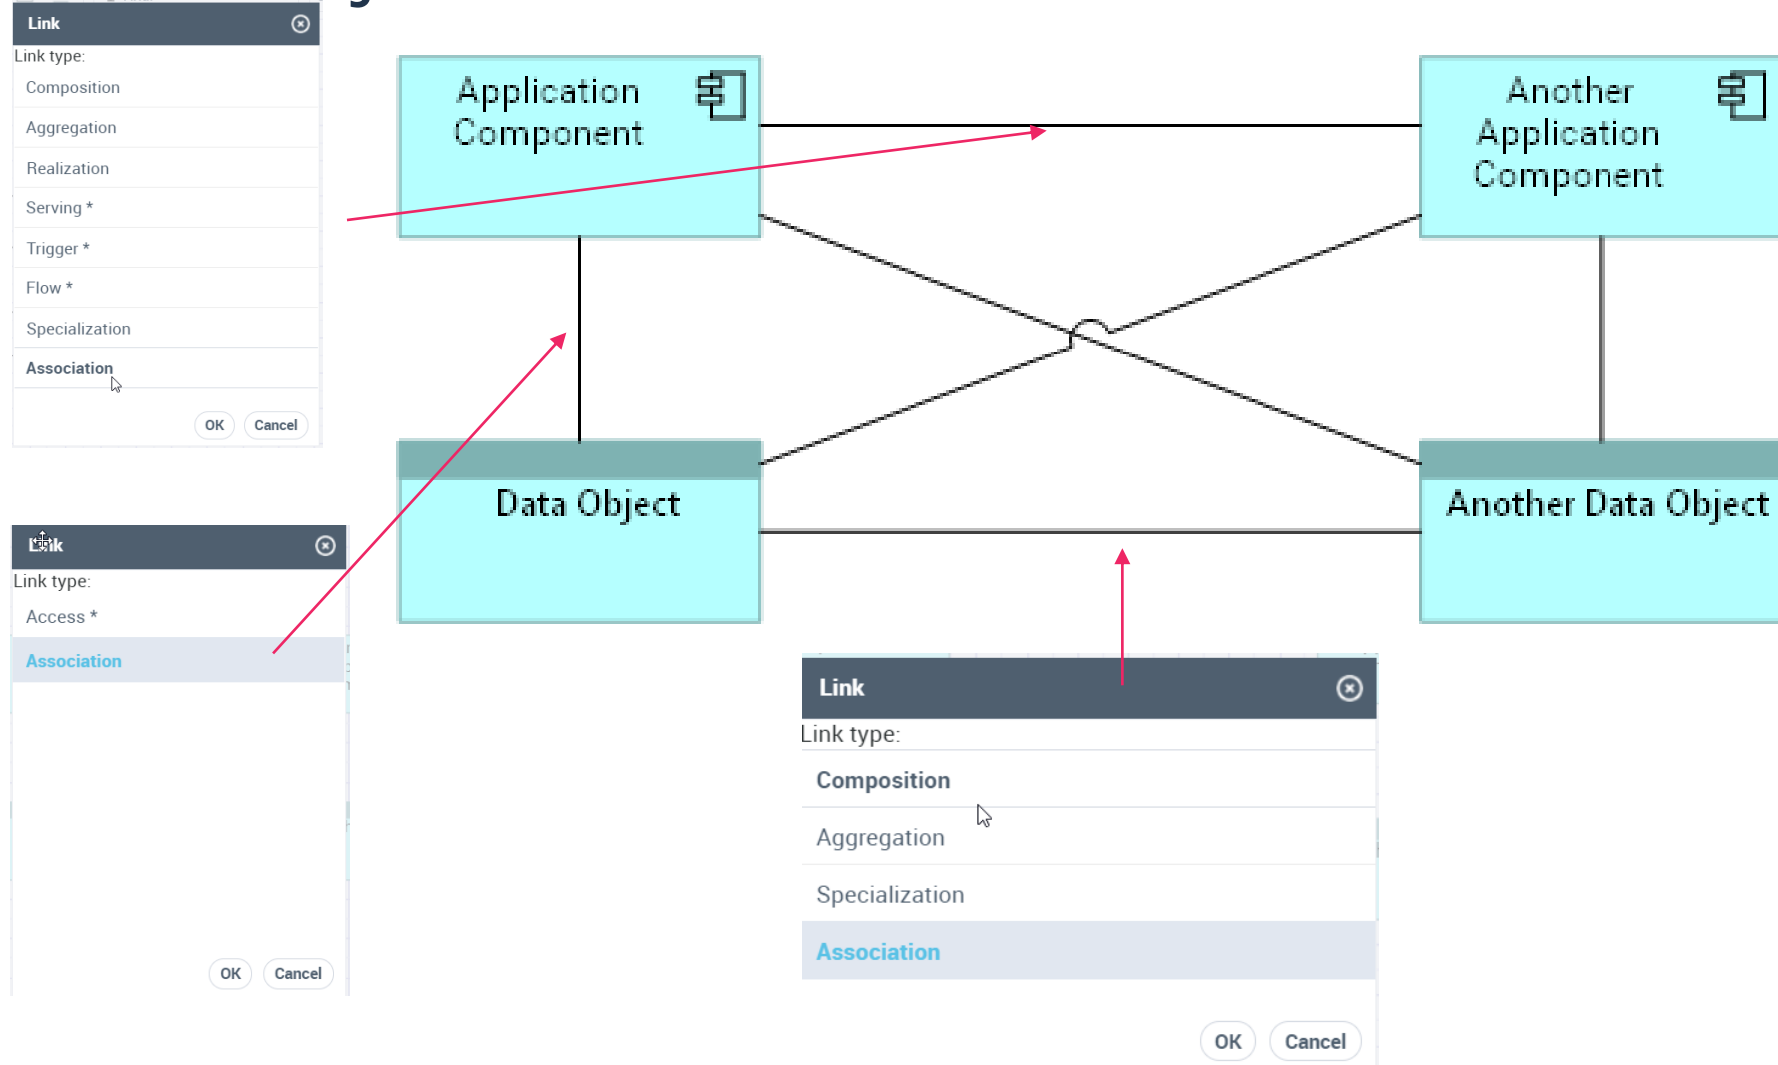

- E.g. right click on a 'ArchiMate Business process' allows to reach the BPMN diagram describing the corresponding 'HOPEX Organizational Process' object

The same applies to other mapped concepts (see mapping in standard documentation page 96)

# Relationships Symbol Reuse (1/2)

Relationships of the same type can be drawn for several pairs of objects

# Relationships Symbol Reuse (2/2)

If a relationship already exists in a given view between two objects, when drawing the same relationship type in another diagram between these two objects, a dialog box suggest the reuse of the existing relationship, to avoid creating a new one by mistake

The image illustrates the process of relationship reuse in a software development tool. It shows a diagram with an **Application Component** and a **Data Object** connected by a dashed line. A **Link** dialog box is shown, with the **Association** link type selected. Below this, the **Add a(n) Association** dialog box is shown, with the **Application Component -> Data Object** association selected. A **Data Object** properties panel is also visible, showing incoming relationships. A red callout box states: "Same association appears twice in a view, but once in repository". Another red callout box states: "Existing Association can be reused".
